

FITNESS FOR A GREAT ENGINEER

– PATHFIT ON CPE CURRICULUM –

Introduction

Behind every well-engineered system is a well-conditioned mind. PATHFIT pairs with the technical needs of Computer Engineering to build the stamina, focus, and discipline students need to thrive in a screen-heavy field.

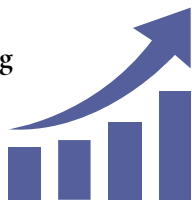

Significance to curriculum

PATHFIT is a course in the curriculum, designed to give these future computer engineers the workout they need to stay fit through exercises despite working long hours in front of a computer screen. It balances the technical and screen-focused nature of the program with physical activities that support both body and mind.

Advantages

The advantages of PATHFIT are that it provides computer engineering students with physical activities that strengthen their body and sharpen their mind and focus while building habits such as discipline and time management that students apply during their coursework.

Knowledge & Skills Gained

Through PATHFIT, computer engineering students learn to properly manage their body and stress through the physical activities done in this course. They also gain the skills of goal-setting, communication, teamwork, and critical thinking.

Challenges

The computer engineering curriculum itself is the challenge for this because of how screen-oriented it is for students. With the way the curriculum is designed, students barely have time to stand up and get exercise.

Career Opportunities & Professional Growth

All the knowledge, skills, and advantages from this course, such as good time-management, discipline, focus, critical thinking, and communication, serve as a foundation for different career fields in computer engineering where long hours, tight deadlines, and continuous learning are the norm.
